

# Terminal Quiz Game

## Submission Status

☰ Terminal Quiz Game  
NOT\_STARTED

S

### Project Overview

You will create a **fully interactive quiz game** that runs in the terminal.

The game will load questions from a file, present them to the user in random order, accept player answers, track scoring and streaks, and save high scores.

This project is designed to stretch your problem-solving, planning, and Bash programming skills while remaining beginner friendly.

You will work with:

file parsing

randomization

loops

user input

basic state management

error handling

multi-part data structures

simple data persistence

### Learning Objectives

By completing this project, you will learn to:

## Bash & Programming Skills

Read structured data (questions) from a file

Parse lines into fields

Use IFS (Internal Field Separator)

Generate random numbers

Validate user input

Use functions to organize code

Handle string comparison

Track and update scores

Store persistent data in files

## Project & Logic Skills

Break a project into modules

Plan and test incrementally

Design a simple data format

Handle edge cases

Create an interactive program flow

## Files You Will Create

You must create these two files:

### 1. `quiz.sh`

Your main Bash script — the quiz game.

### 2. `questions.txt`

A text file containing your quiz questions.

## Question File Format

Your `questions.txt` must store each question as:

Question text|A) option|B) option|C) option|D) option|Correct letter

For example:

What is the capital of France?|A) Paris|B) Rome|C) Berlin|D) Madrid|A

2 + 2 equals?|A) 3|B) 4|C) 22|D) Thanks|B

You must create **at least 15 questions**.

## Project Requirements

Your script must fulfill *all* of the following requirements.

### 1 Load Questions from File

Read each line of the file

Split into **question text**, **4 options**, **correct answer**

Store or process them in a loop

If the file is missing or empty, show an error

### 2 Randomize the Order

Before asking questions, shuffle their order

Multiple methods allowed (e.g., shuffling with `shuf`, or manual random indexing)

### 3 Present Each Question to the User

For each question:

Clear the screen (optional but nice: `clear`)

Show question text

Show options A–D

Ask the user to enter their answer (A/B/C/D)

The program must:

Validate the input

Accept uppercase or lowercase

Reject invalid answers and re-ask

### 4 Track Game Statistics

You must track:

Total questions asked

Number of correct answers

Number of incorrect answers

Longest correct streak

Current streak

At the end of the game, print a summary:

Correct: 12Incorrect: 3Longest streak: 5Final score: 80%

## 5 High Score System

Your script must store user performance in a file named `highscores.txt`.

For each play session, append:

`username|score|correct/total|date`

Where:

`username` is entered at the start

`score` is in percent

`date` can be generated with `date "+%Y-%m-%d"`

Example:

`alice|80|12/15|2025-02-11`

Your script must also support:

➤ `./quiz.sh highscores`

Print the top 5 scores with formatting.

## 6 Add a "Practice Mode"

Practice mode shows the correct answer immediately after each guess and does not track high scores.

Launch it with:

`./quiz.sh practice`

Behavior:

After answering, show:

Correct! (A)

or

Incorrect . The correct answer was C)

No streaks, no scoring, no saving high scores

Still loads and randomizes questions

## 7 User-Friendly Output

Your script must:

Display clear instructions

Show progress (e.g., "Question 4 of 15")

Use spacing and formatting

Avoid clutter

Colors are optional but encouraged:

```
echo -e "\e[32mCorrect!\e[0m"
```

## Technical Constraints

Must be implemented in **pure Bash**

Must run by typing `./quiz.sh`

Must validate all user inputs

Must not rely on external programming languages

beginner-friendly You may use standard utilities (cat, shuf, grep, sed, awk, etc.)

## Project Checks

Is the folder structure correct

Are all linter tests passing

Is the branch name correct

Was the pull request created correctly

Are all related changes included in this Pull Request

Includes all required files

Includes the questions file
